"Innovative respiratory protective solutions".

We often find a situation where the manufacturers in Mining and Mine Rescue fields release equipment, but neither have not been upgrading it for years, nor improve its technical and operational parameters according to the users' feedback.

For sure, the Mine Rescue is a very conservative society; it uses only proven technologies and products. For example, the most of Close-Circuit SCBAs, used by many organizations, have been developed in the last century!

While we are living in the XXI century - the epoch of technological leap and progress of many disciplines: physics, chemistry, thermodynamics, electronics, and materials science. So, why do not we use all these latest technologies for new innovative solutions in RPEs?
